

OPERATIONAL DESCRIPTION

SRW-KR303/315/318/433-BENZO

By pressing a button on the transmitter, the IC transmits a digital signal to modulate the transmit circuit. Subsequently, the amplifier powers on and off as follows: A high level modulated signal will open the transmit circuit to produce a high frequency wave-carrying signal, which is sent via the antenna. Next, a low level modulated signal closes the transmit circuit.
